## Can a blind person see again

Can a blind person see again naturally. Can a blind person see again with eye transplant. Can you make a blind person see again. Can a blind person see again without surgery. Can a blind person see again reddit. Can a blind person get an eye transplant and see again. Can a completely blind person see again.

February 14, 2007Many of us have met a person who never remembers who we are, no matter how many times we meet and introduce ourselves. At some point, most of us start getting insulted – how many times can you attribute it all to a bad memory, anyway? But it’s actually a medical condition that would completely explain this person’s inability to recognize you, and it has nothing to do with the person who’s an idiot. It’s called prosopagnosia, or facial blindness, and researchers are beginning to realize that it affects many more people than they previously thought.People with prosopagnosia (from the Greek prosopon for “face” and “agnosia”, which is the scientific word for “recognition problems”) can perceive facial features well; if they look at a face, it could tell you what the eyes look like, how big the nose is, what colour they are. lips and if there is a crack in the chin. But they can’t keep the memory of these characteristics. So when they see a face for the second, third or fiftieth time, it’s like seeing it for the first time. They just don’t recognize him. In cases of severe prosopagnosia, people don’t even recognize their face when they look in the mirror. Although science does not fully understand the disorder, it knows enough to draw some conclusions about where the problem comes from. This is an area of the brain that deals with the visual perception of facial traits. When looking at a face, the fusiform circumference, located in the temporal lobe, is stimulated. And most people, when they look at that face again, they recognize it as something they’ve already seen. But people with facial blindness don’t. The researchers conclude that the problem has something to do with the fusiform gyrus itself or with the neural pathways that carry information from that area to other parts of the brain, such as the occipital lobe, which processes visual information. Face blindness can result from brain damage, such as a car accident or stroke, or a person can be born with it. Some research suggests that facial blindness can be transmitted by only one gene, even if no one has yet identified the gene or what it does.Unless you suffer from prosopagnosia, it’s easy to forget how much we rely on facial recognition in our daily lives. How would you get through the workday if your colleagues seemed strangers at the beginning of each day? Would your friends find it unpleasant if I had to ask their names when you met for lunch? Would movies lose some of their appeal if I thought every woman with brown hair was the same character? What if someone came to your door and said, “It’s Anne, your sister. Can I borrow \$20 and pay you back tomorrow?” How would you confirm that this With the same hair color and the same body type as your sister was, in fact, Anne, if you were home alone?To address these problems, people with facial blindness need to find other tips for identity to function in daily life. If you had prosopagnosia, you could come to work every day and go around your coworkers’ desks and take notes on what everyone wears. You could set up verbal cues with your friends and family, so unscrupulous strangers couldn’t take advantage of your mess. If your son has a mole on his right hand, you might recognize him that way. For many people with severe forms of the disorder, TV shows and movies are pretty much like sources of vital entertainment – it’s just too hard to follow a plot when there are a dozen central characters and you can’t remember everyone from one scene to the next. During the medical community, prosopagnosia has been extremely rare, with recent research suggesting that as many as 50 people may suffer from some degree of face. Extreme blindness of the face can be socially paralyzing, while milder forms can only result in occasional frustration or embarrassment. Protopagnosia is just one of many disorders of recognition. Other visual recognition disorders include Agnostic Aessia, Agnosia Agnosia and Object Agnosia, in which the person is unable to recognize written words, colors and objects respectively. There are also various hearing and tactile recognition disorders.
